

Too Large Code Files Can Become Hard To Maintain

The MVC Pattern

Model

Contains logic for interacting with your data and data storage

e.g. defines functions / methods for storing data in a database or fetching data from a database

View

Contains logic for presenting data / content to the user

Typically, that's your templates + the logic (e.g. EJS tags) in there

Controller

Connects models with views

Typically connected to your routes

You don't have to use the MVC pattern but it's a common pattern and a good choice for many projects
